

## 6.2. Referring

### 6.2.0. Overview

Much of the work in analyzing predications lies in recognizing the individual terms that fill their blanks and in analyzing these individual terms further.

#### 6.2.1. Individual terms

While individual terms are not limited to proper names, they do not include all noun phrases, only the ones that function like proper names.

#### 6.2.2. Functors

Individual terms can be formed from other individual terms by operations analogous to predicates.

#### 6.2.3. Examples and problems

These operations enable us to continue the analysis of sentences beyond the analysis of predications by analyzing individual terms themselves.
