on a  
Computer

W. J. Turner

Symbolic  
Computation

Symbolic  
Algorithms

Black Box  
Matrix Model

Wiedemann  
Method

Background  
The Method

## Ancient Algorithms

- Euclidean algorithm for finding the greatest common divisor
- Chinese remainder algorithm

## Isaac Newton's *The Universal Arithmetic* (1728)

Systematically discusses rules for manipulating universal mathematical expressions, that is, formulae containing symbolic indeterminates, and algorithms for solving equations built with these expressions.

# Symbolic Computation vs. Numerical Analysis

Symbolic  
Computation

Symbolic  
Algorithms

Black Box  
Matrix Model

Wiedemann  
Method

Background  
The Method

## Numerical Analysis

- Floating point numbers (approximate real values)
- Find approximation quickly
- Error propagation important

**Condition Numbers:** amplification factors of relative errors

**Stability:** whether all roundoff errors of an algorithm  
are harmless

## Symbolic Computation

- Find exact solution quickly
- May never approximate (may have no metric)

# Symbolic Computation vs. Numerical Analysis

## General Approach

- Computer has finite memory
- Cannot compute exactly over reals, rationals, integers, etc.
- Compute bound on desired solution
- Use finite field methods to find solution modulo  $p_i$
- Reconstruct solution (e.g., Chinese remainder algorithm)

# Probabilistic Algorithms

## Schwartz-Zippel Lemma

Let  $R$  be an integral domain,  $n \in \mathbb{N}$ ,  $S \subset R$  finite with  $s = |S|$  elements, and  $f \in R[\lambda_1, \dots, \lambda_n]$  a polynomial of total degree at most  $d \in \mathbb{N}$ .

- 1 If  $f$  is not the zero polynomial, then  $f$  has at most  $ds^{n-1}$  zeros in  $S^n$ .
- 2 If  $s > d$  and  $f$  vanishes on  $S^n$ , then  $f = 0$ .

## Monte Carlo to Las Vegas

- Requires certificate to check if solution is correct
- If not correct, run Monte Carlo Algorithm again

## Las Vegas to Monte Carlo

- Start Las Vegas algorithm and let run for set period of time
- Will stop early with given probability  $p$ 
  - Solution guaranteed to be correct
  - Return correct answer
- Will not stop early with probability  $1 - p$ 
  - Halt algorithm
  - Return some answer
  - Need not be correct

## Solving a Linear System of Equations

- Solve  $Ax = b$  where  $A \in \mathbb{F}^{n \times n}$  and  $b \in \mathbb{F}^n$
- $A$  nonsingular or singular

## Matrix Determinant

- $\det(A)$  where  $A \in \mathbb{F}^{n \times n}$
- $A$  nonsingular

## Matrix Rank

- $\text{rank}(A)$  where  $A \in \mathbb{F}^{n \times n}$
- $A$  singular

Computation

Symbolic  
Algorithms

Black Box  
Matrix Model

Wiedemann  
Method

Background  
The Method

## Example

$$\begin{bmatrix} 1 & 3 & 0 & 3 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -2 & -6 \\ 0 & 0 & 0 & -2 \end{bmatrix} x = \begin{bmatrix} 4 \\ 2 \\ 6 \\ 2 \end{bmatrix} \implies x = \begin{bmatrix} 1 \\ 2 \\ 0 \\ -1 \end{bmatrix}$$

## Gaussian Elimination

- Row echelon form and back substitution
- Must know how matrix stored
- Matrix changed in calculation
- Sparse matrices may become dense

# Black Box Matrix Model

## Black Box Matrix Model

- External view of matrix
- Only matrix-vector products allowed
- Independent of implementation
- Implementations may be efficient in time or space
- Not unique to symbolic computation
- Can compute Krylov sequence  $(A^i v)_{i \in \mathbb{Z}_{\geq 0}}$

# Possible Black Box Matrices

## Definition

- Let  $\mathbb{V}$  be a vector space over field  $\mathbb{F}$ .
- A sequence

$$a = (a_i)_{i \in \mathbb{Z}_{\geq 0}} \in \mathbb{V}^{\mathbb{Z}_{\geq 0}}$$

is *linearly recurrent* if and only if there exist  $m \in \mathbb{Z}_{\geq 0}$  and

$$c_0, \dots, c_m \in \mathbb{F}, \quad c_m \neq 0$$

such that for all  $i \geq 0$

$$\sum_{j=0}^m c_j a_{i+j} = 0 \text{ or } a_{i+m} = -\frac{1}{c_m} \left( \sum_{j=0}^{m-1} c_j a_{i+j} \right)$$

# Linearly Recurrent Sequences

## Definition

The polynomial  $f(\lambda) = \sum_{j=0}^m c_j \lambda^j$  generates  $a$

## Example (Fibonacci Numbers)

- $(a_i)_{i \in \mathbb{Z}_{\geq 0}} = (0, 1, 1, 2, 3, 5, 8, 13, 21, 34, \dots)$
- $a_{i+2} - a_{i+1} - a_i = 0$
- $f = \lambda^2 - \lambda - 1$  generates the Fibonacci sequence  $a$

# Generating Polynomials

## Module

- Define  $f \bullet a = \left( \sum_{j=0}^m c_j a_{i+j} \right)_{i \in \mathbb{Z}_{\geq 0}} = (0)_{i \in \mathbb{Z}_{\geq 0}} = 0 \in \mathbb{V}^{\mathbb{Z}_{\geq 0}}$
- $\mathbb{V}^{\mathbb{Z}_{\geq 0}}$  is an  $\mathbb{F}[\lambda]$ -module
- If  $f \bullet a = 0$  and  $g \in \mathbb{F}[\lambda]$ , then

$$(g f) \bullet a = g \bullet (f \bullet a) = g \bullet 0 = 0$$

## Example (Fibonacci Numbers)

- $(a_i)_{i \in \mathbb{Z}_{\geq 0}} = (0, 1, 1, 2, 3, 5, 8, 13, 21, 34, \dots)$
- $f = \lambda^2 - \lambda - 1$  generates the Fibonacci sequence  $a$
- $(\lambda + 1)f = \lambda^3 - 2\lambda - 1$  also generates  $a$ 
  - $a_{i+3} - 2a_{i+1} - a_i = 0$
  - $a_{i+3} = 2a_{i+1} + a_i$
- $\lambda^k f = \lambda^{k+2} - \lambda^{k+1} - \lambda^k$  also generates  $a$ 
  - $a_{i+k+2} - a_{i+k+1} - a_{i+k} = 0$
  - $a_{i+k+2} = a_{i+k+1} + a_{i+k}$
  - Skips first  $k$  elements of  $a$

# Minimal Generating Polynomial

The Method

## Existence

- $\{f \in \mathbb{F}[\lambda] \mid f \bullet a = 0\}$  is an ideal
- $\mathbb{F}[\lambda]$  is a principal ideal domain
- There exists a unique monic generator of minimal degree, the *minimal generating polynomial* of sequence
- Minimal polynomial divides all generating polynomials

## Example (Fibonacci Numbers)

The polynomial  $f = \lambda^2 - \lambda - 1$  is the minimal generating polynomial of the Fibonacci sequence  $a$ .

## Matrix Power Sequence

- $f \bullet (A^i)_{i \in \mathbb{Z}_{\geq 0}}$  if and only if  $f(A) = 0$
- $\det(\lambda I - A)$  generates  $(A^i)_{i \in \mathbb{Z}_{\geq 0}}$ 
  - Cayley-Hamilton Theorem
- Let  $f^A$  be the minimal polynomial of  $(A^i)_{i \in \mathbb{Z}_{\geq 0}}$ .
  - $f^A \mid \det(\lambda I - A)$
  - $\deg(f^A) \leq \deg(\det(\lambda I - A)) = n$

## Using Linear Recurrences to Solve a Linear System

- Suppose  $g = \sum_{j=0}^m c_j \lambda^j$ ,  $g(0) = c_0 \neq 0$ , and  $g \bullet (A^i b)_{i \in \mathbb{Z}_{\geq 0}}$
- If  $g$  exists, then  $f^{A,b}$  satisfies the requirements.
- Consider linear combination
$$c_0 b + c_1 A b + \cdots + c_m A^m b = 0$$
- $$b = -\frac{1}{c_0} \sum_{j=1}^m (A^j b) = A \left( -\frac{1}{c_0} \sum_{j=1}^m (c_j A^{j-1} b) \right)$$
- $x = -\frac{1}{c_0} \sum_{j=1}^m (c_j A^{j-1} b)$  is a solution

# Nonsingular Matrix

## Degree Bound

Must know bound  $M \geq \deg(f)$

## Extended Euclidean Algorithm

- $s_j f_{-1} + t_j f_0 = f_j$
- Inputs are  $f_{-1} = \lambda^{2M}$  and  $f_0 = \sum_{i=0}^{2M-1} (a_i \lambda^i)$
- Stop when  $\deg(f_j) \leq M < \deg(f_{j-1})$
- Minimal polynomial is reversal of  $t_j(\lambda)$

## Berlekamp-Massey Algorithm

- From coding theory
- Interpolates elements of scalar sequence
- Related to Extended Euclidean Algorithm

# Wiedemann's Algorithm

## Degree Bounds

- $f_u^{A,v} \mid f^{A,v} \mid f^A \mid \det(\lambda I - A)$
- $\deg(f_u^{A,v}) \leq \deg(\det(\lambda I - A)) = n$
- Only need  $(u^T A^i b)_{i=0}^{2n-1}$

## Wiedemann's Algorithm

**Require:** nonsingular  $A \in \mathbb{F}^{n \times n}$  and  $b \in \mathbb{F}^n$

**Ensure:**  $x \in \mathbb{F}^n$  such that  $Ax = b$

- 1:  $u \leftarrow$  random vector in  $S^n$  where  $S \subset \mathbb{F}$
- 2: use Berlekamp-Massey to compute  
 $f^{A,b} = c_0 + c_1\lambda + \dots + c_m\lambda^m$  {Store only  $A^i b$ }
- 3:  $x \leftarrow -\frac{1}{c_0}(c_1 b + c_2 A b + \dots + c_m A^{m-1} b)$

# Back to original problem

## Example

- $$\begin{bmatrix} 1 & 3 & 0 & 3 \\ 0 & 1 & 0 & 0 \\ 3 & 3 & -2 & 3 \\ 0 & -3 & 0 & -2 \end{bmatrix} x = \begin{bmatrix} 4 \\ 2 \\ 6 \\ -4 \end{bmatrix}$$

- $n = 4$

- $u^T = [2 \ 1 \ 1 \ 2]$

- $(u^T A^i b)_{i=0}^{2n-1} = (8, -4, 20, -28, 68, -124, 260, -508)$

- $f^{A,b} = f_u^{A,b} = \lambda^2 + \lambda - 2$

- $$x = \frac{1}{2} (Ab + b) = \frac{1}{2} \left( \begin{bmatrix} -2 \\ 2 \\ -6 \\ 2 \end{bmatrix} + \begin{bmatrix} 4 \\ 2 \\ 6 \\ -4 \end{bmatrix} \right) = \begin{bmatrix} 1 \\ 2 \\ 0 \\ -1 \end{bmatrix}$$
